

What is MappNgo?

It was an iOS application with many unique, interesting, and hidden city walks created by MappNgo and its users. Route guides could be found by location or by included points. The project is now closed.

How did the application work?

The app was planned for release exclusively on the App Store, but the project closed before a public launch. Any user could add and use route guides, but most features required registration. The application was free and did not offer any in-app purchases.

What types of places were in a route guide?

Route guides could consist of 4 categories of places: «Outdoors», «Culture», «Food and drinks» and «Other». Each category has its own icon, so every user could choose the best route as easy as possible.

How could a user find a suitable route guide?

- Through the general list on the MappNgo home screen. Route guides were sorted by rating and the user's map position — only the guides visible within the current map area were shown. The smaller the scale, the more guides were shown; the larger the scale, the fewer guides were shown.
- By searching on the home screen. You only had to enter the name of a point of interest or a route guide, and you could be on your way.
- Via top route guide lists: weekly, monthly, and all time. These lists were generated by rating only and did not take the user's current location into account.

How could a user add a new route guide?

MappNgo was based on the Google Maps API, which made it easy to add any place from the extensive Google database. Also, it was possible to add a unique personal point.

For each route guide, the user had to specify the following information:

- Guide name;
- Brief description;
- Background photo;
- Information about each point: name, category and short description.

Was it possible to save favorite route guides?

Users could add any route guide to the "Favorites" section, share it with friends, and rate it.

How could the navigation feature be activated?

The navigation feature was based on Google Maps directions. To activate it, the user had to press the "Navi" button, which appeared on the right side of the screen after starting a route guide. It was also possible to start navigation to a specific point via a pop-up window with its description.
